

WPV Flu Clinics 2021

Frequently Asked Questions

What kind of flu vaccine do you offer? WPV offers the **Fluzone** flu vaccine, which protects against four flu strains. The vaccine is standardized according to United States Public Health Service requirements and is formulated to contain each of the following four influenza strains recommended for the 202M-202H influenza season:

- an A/Wisconsin/588/2019 (H1N1) pdm09-like virus;
- an A/Cambodia/e0826360/2020 (H3N2)-like virus;
- a B/Washington/02/2019- like virus (B/Victoria lineage);
- a B/Phuket/3073/2013-like virus (B/Yamagata lineage).

Can the flu vaccine give me the flu? No, a flu vaccine cannot cause flu illness. The vaccine is made with a virus that has been killed (inactivated) and is therefore not infectious.

Does the flu vaccine work right away? It takes about two weeks after vaccination for antibodies to develop in the body and provide protection against influenza virus infection. That's why it's best to get vaccinated before influenza viruses start to spread in your community.

Will a flu vaccine protect me against COVID-19? No, getting a flu vaccine will not protect against COVID-19, however flu vaccination has many other important benefits. Flu vaccines have been shown to reduce the risk of flu illness, hospitalization and death. Getting a flu vaccine this fall will be more important than ever, not only to reduce your risk from flu but also to help conserve potentially scarce health care resources.

Should pregnant women receive a flu shot? Yes! The CDC highly recommends flu immunizations for pregnant mothers. WPV offers a preservative free option for pregnant women.

How long does it take to receive a flu shot? Getting your flu shot is a simple process! Once you have completed your consent form, vaccination takes less than a minute.
